## Getting Started

- Initial getting started with development is kind of confusing
- The first setup section can not be completed without doing the Auth section, so it would have been nicer to split it up at the `# set up credentials store` part.
- However, once that was figured out, there were no issues getting started with the site, and we easily got it running on our local machines
- Another minute detail was that in the Google Cloud, the only scopes we could find were the `userinfo.email` and `userinfo.profile`, as opposed to `userinfo.email` and `userinfo.name`.

## Running Tests

- All Rspec tests worked
  - 947/947 LOC for 100% coverage
- All Cucumber tests passed
  - 165 scenarios
  - 1447 steps
  - All passed
- No issues getting tests running

## Deployment

- Deployment initially breaks due to  
`ActiveSupport::MessageEncryptor::InvalidMessage:`  
`ActiveSupport::MessageEncryptor::InvalidMessage`
  - This happens when running `git push heroku main`
    - Likely due to credential encryption issue
  - Various fixes were tried such as the following
    - Setting credentials in production environment
    - Deleting `master.key` as well as `credentials.yml.enc`
  - However, after looking online, the steps mentioned in the readme should be correct.
- Went off local for functionality
  - Budget tab still seems to be WIP
  - Otherwise app looks good

## How to contact

- No information about how to contact team directly
  - No email or contact address

- Only told to create an issue
